Callback V2

Important

The **Callback V2** block relies on callback functionality provided by Genesys Mobile Services. Read the [Callback User's Guide](#) for more information on how to implement this feature.

You can use the **Callback V2** block in the **Assisted Service** phase of your **Default** type application for inbound calls. Designer supports the following types of callbacks:

- Immediate (or in-queue) callbacks, where the caller requests a callback when the next agent is available.
- Scheduled callbacks, when the caller selects a preferred time and date for the callback.
- Web-invoked callbacks, where the caller requests a callback using an HTTP request (such as a website or a mobile application to request a callback when an agent is available).

You can use the **Callback V2** block in the **Initialize** phase of your **Callback** type application for Scheduled callback. This block processes the Scheduled callback at the desired time.

Before using the **Callback V2** block, you must first create a [variable](#) for the callback virtual queue. Then, you can use Special Days, Business Hours, and Data Tables (under [Business Controls](#)) to specify your business requirements and associate those settings with the virtual queue.

The settings for callback virtual queues are stored in the [Callback_Settings](#) data table.

Warning

The Callback V2 feature can only be used with [Callback V2 blocks](#).

Sample callback scenarios

The following scenarios describe sample call flows for immediate and scheduled callbacks.

Immediate callbacks

- The session starts when the customer's call arrives.
- The caller is offered immediate (or in-queue) callback. They accept, and confirm the number they want to be called at.

- At this point, the caller can hang up. The voice interaction is converted to a virtual call and added to the queue.
- While the virtual call waits in the queue, the session remains active and continues to monitor statistics for the call, such as the Estimated Wait Time (EWT) and its position in the queue.
- When an agent that satisfies the required skill expression is ready, the customer is called.
- Music on hold plays while the call is being routed to the agent.
- Once the agent connects to the call, the virtual call is removed from the queue and the session ends.
- (Optional) If survey is enabled and the caller has agreed to take it, the caller is taken to the survey application after the agent disconnects.

Scheduled callbacks

- The session starts when the customer's call arrives.
- The caller is offered a scheduled callback. They accept, and confirm the number they want to be called at, along with the date and time when they would like to receive the callback.
- At this point, the caller can hang up.
- When an agent that satisfies the required skill expression is available, the customer is called.
- Music on hold plays while the call is being routed to the agent.
- Once the agent connects to the call, the virtual call is removed from the queue and the session ends.
- (Optional) If survey is enabled and the caller has agreed to take it, the caller is taken to the survey application after the agent disconnects.

Call Routing tab

Select the **Virtual Queue** that you are going to use for callback. Designer uses this Virtual Queue to fetch the associated configuration settings from the **CALLBACK_SETTINGS** data table.

Properties - Callback V2

This block is used to offer callback and reconnect to the customer when an agent is ready.

  Result

Select Virtual Queue

This virtual queue is used as the key to fetch additional settings from the `CALLBACK_SETTINGS` data table.

callbackVQ

Advanced Options - Overrides ▼

Advanced Options - Overrides

(Optional) You can expand the **Advanced Options - Overrides** section to select your own variables for certain parameters. For example, your business might require that an offer or skill expression parameter override the current setting in **CALLBACK_SETTINGS** with a different value.

Important

Variables used for overrides must be provided as *boolean* values (for example, true/false, or 0/1). Otherwise, Designer interprets the variable lookup as false.

Offer Callback tab

In the drop-down menu, select **Callback V2 - Offer Callback** to use the pre-packaged template for callback.

The inbound callback feature is provided by a series of **shared modules**. The **Callback V2** block hands off the call to one main shared module that guides callers through the callback process. This shared module might rely on one or more supporting shared modules to extend its functionality (such as to collect a phone number or negotiate a time for **Scheduled** callback). When the callback process is complete, the main shared module returns the call to your application.

For ease of use, you can use shared module templates that provide pre-packaged callback functionality. The templates are read-only and cannot be edited or deleted. If you want to modify these templates, go to the **Shared Modules** list and click **Clone** beside a template to create a copy for editing.

Warning

Although you can copy a template to modify its prompts or behavior, you must not change its inputs or outputs. Doing so might cause unexpected behavior or application errors. If you want to change audio prompts only, you can modify audio resources in the **Callback V2 Audio** audio collection, which you can access by going to the [Media Resources](#) window.

Connect Customer tab

In the drop-down menu, select **Callback V2 - Calling Back** to use the pre-packaged template for callback.

The outbound callback feature is provided by a [shared module](#).

For ease of use, you can use a shared module template that provides pre-packaged callback functionality. The template is read-only and cannot be edited or deleted. If you want to modify this template, go to the **Shared Modules** list and click **Clone** beside the template to create a copy for editing.

Warning

Although you can copy a template to modify its prompts or behavior, you must not change its inputs or outputs. Doing so might cause unexpected behavior or application errors. If you want to change audio prompts only, you can modify audio resources in the **Callback V2 Audio** audio collection, which you can access by going to the [Media Resources](#) window.

Routing Priority tab

Enable the **Use Priority during Routing** check box to use priority-based routing, which prioritizes your calls depending on your business requirements.

To prioritize calls, you should set the **Initial Priority** based on your business segmentation (for example, *Gold* customers start at Initial Priority = 50, *Silver* customers start at Initial Priority = 30, and *Bronze* customers start at Initial Priority = 0).

Enable the **Increment Priority every ____ seconds** check box to specify the time interval between priority increments. If you enable the other check box beside the field, you can select a variable that specifies the overall **Routing Timeout** and **Priority Increment Interval** properties.

If the **Increment Priority every ____ seconds** option is enabled, you can use the **Limit Priority to** option to set a maximum priority value. For example, if the initial priority is 50, you can use this option to not let the priority value increase beyond 100.

If you enable the other check box beside the field, you can select a variable for this option.

If the **Use Priority during Routing** option is enabled, you can choose to select the **Set Agent Reservation Priority to current priority** option. This applies the current priority (the priority of the call at the time an agent was found for the callback) to reserve the agent. If you do not select this option, the default value of 10,000 is applied to the request.

Example

Properties - Callback V2

This block is used to offer callback and reconnect to the customer when an agent is ready.

Connect Customer **Routing Priority** Advanced Result

These values are only used for web invoked callbacks. For scheduled callbacks accepted, please configure priorities in the application handling the inbound call.

- ☒ Use Priority during Routing
- ☒ Increment Priority every Seconds
- Initial Priority
- Priority Increment Size
- ☐ Limit Priority to
- ☐ Set Agent Reservation Priority to current priority

The default priority is 10,000 but can be set to the priority set above

Tip

Ideally, the **Route Call block** and **Callback V2** block should have their priorities synchronized, so that their rate of increase is the same. One way you can do this is by using variables for the **Initial Priority**, **Increment Priority every...**, **Priority Increment Size**, and the **Limit Priority to...** settings.

Advanced tab

Greetings

Enable the check box beside **Customer Greeting** and/or **Agent Greeting** to play an audio file to that person while the call is being connected.

For customers, you might use this feature to play a legal disclaimer, or to announce that the call might be recorded (if you use call recording in your contact center). For agents, you might use a variable to announce the customer name or other relevant information.

After you enable **Customer Greeting** and/or **Agent Greeting**, you can select an audio file to play by clicking the icon in the **Announcement** field. This is useful for customer greetings that play a static disclaimer audio file.

Optionally, enable the **Var?** check box to use a variable to dynamically select the audio file. This is useful for agent greetings that use a variable to provide call-specific information, such as the customer name.

Music on Hold

Enable **Music on hold** to select the music file that plays while callers are on hold.

Reporting

Enable **Put (re)connected call into a virtual queue** if you would like to place the real interaction in a separate virtual queue for reporting purposes, to differentiate between regular calls and calls routed to agents as a result of a callback.

You can either select a virtual queue that is defined in the application or you can add a suffix to the virtual queue that is used for the inbound call. For example, if the callback virtual queue is named *VQ1_cb*, and the suffix is *_out*, the reconnected virtual queue should be configured as *VQ1_cb_out*.

The following options enable you to specify the metrics to display in reporting:

Enable **Show the EWT of the inbound VQ when callback was offered** to specify the name of the inbound virtual queue. You can select a variable or one of the virtual queues available in the drop-down menu.

Enable **Show the threshold that was used to determine if callback should be offered** to specify the **Callback EWT Threshold value** (in seconds). You can select a variable or enter an integer.

Survey

(If survey is enabled) Enable **Route to a different RP than previously specified in Setup Survey block** if you need to change the routing point to use for the survey application after the agent disconnects. Otherwise, the routing point configured in the **Setup Survey block** is used.

Example

800px

Result tab

(Optional) In the drop-down, select a variable to store the outcome of the callback interaction.

Callback Settings Data Table

The callback settings for each virtual queue are stored in a special data table called **CALLBACK_SETTINGS**. You can view the settings for this data table by selecting it on the [Data Tables](#) page.

The data table includes a default queue that is already populated with the recommended values. To add a new virtual queue, simply add a new row to the data table. Each parameter is automatically assigned the default setting, but you can edit the values to further refine and customize the callback settings for each virtual queue.

If you are making changes to this data table, note the following:

- Genesys recommends that you do not set the *Callback_TTL* ("Time to Live") value lower than the default setting of 259200 seconds (3 days). This value specifies how long the callback service will be kept active in the system. If you set this value too low, the callback is removed from the system before the customer receives their callback. (This value does not apply to scheduled callbacks, as those can be booked up to a week in advance.)
- If your application is not automatically detecting the caller's number (ANI), you might have to use the *Dial Prefix* setting to enter a country calling code, or use the audio prompts to ask callers to include their country code when manually entering their callback phone number.
- The value for *Slot Duration (minutes)* must be a divisor of 60. The recommended values are 15 (default), 20, 30, or 60, with 60 being the maximum value you can use.

Parameters

This data table contains the following parameters:

Setting	Description
VQ	Name of the Virtual Queue.
Immediate Enabled	Enables (or disables) the option to offer Immediate Callback.
Hold Enabled	Enables (or disables) the option to Hold (or Reject) a callback.
Logged In Check	Checks to see if any agents are logged in before offering Immediate Callback. If this feature is enabled and no agents are logged in, Immediate callback is not offered.
Immediate Blackout (minutes)	<p>This value acts as a cut-off time (in minutes) before the end of the business day when Immediate callbacks won't be offered. For example, if the business closes at 5:00 PM and the Immediate Blackout value is set to 60 minutes (default), customers who call and receive an estimated waiting time that exceeds 4:00 PM (i.e. 60 minutes before closing) won't be offered an Immediate callback.</p> <p>Important If Immediate Offer Hours is configured, this option is ignored.</p>
Callback Purge Time (minutes)	<p>Duration (in minutes) to keep a callback session alive before we make a courtesy call to reschedule or cancel the callback because no agents were found and the callback cannot be processed. However, the courtesy call will be made at the end of the business day if the business closes before the callback session alive time.</p> <p>Tip You might want the courtesy outbound call to happen at the end of the business day. To do this, set the value of this parameter to a number that is greater than the total number of minutes the office is open. For example, an office with business hours of 09:00–17:00 would be open 480 minutes (or 8 hours). Setting this parameter to a higher value, such as 500, would initiate an outbound call to the customer after business hours (for example, to inform them that no agents were available and to provide them with the option to reschedule or cancel the callback).</p>
Call Display Name	Name to display for Caller-ID.
Call Display Number	Number to display for Caller-ID.
Enable CPD	Enables (or disables) Call Progress Detection.

Setting	Description
CPD Timeout (seconds)	Specifies the maximum time (in seconds) allowed for Call Progress Detection after the call is connected.
Dial Prefix	<p>The prefix to add to the phone number for outbound dialing. (This should only be used to add the country code, if desired. The + should not be added here, since it should already be configured in the dial plan.)</p> <p>Important If your application is not automatically detecting the caller's number (ANI), you might have to use this setting to enter a country calling code, or use the audio prompts to ask callers to include their country code when manually entering their callback phone number.</p>
Dial Retry Timeout (seconds)	Time to wait (in seconds) before making another attempt to dial an outbound call, if the previous attempt failed.
Max Dial Attempts	Maximum number of times to try dialing an outbound call.
Min Time Before Callback (seconds)	Minimum time (in seconds) between the disconnection of the inbound call and the dialing of the outbound call.
Snooze Duration (minutes)	Time to wait (in minutes) before dialing a caller who chose the "snooze" option from the menu.
Push retry Timeout (seconds)	<p>Time to wait (in seconds) before the next push notification is sent to the caller.</p> <p>Important This setting is currently not supported.</p>
Max Push Attempts	<p>The total number of push notifications to be sent to the caller.</p> <p>Important This setting is currently not supported.</p>
Skill Expression	The skill expression to use for targeting an agent. (Example: Billing>0&Collections>0)
Attach Userdata	Specifies the format in which the user data should be attached to the interaction before it is routed to an agent.

Setting	Description
	<ul style="list-style-type: none"> • Selecting single_json will attach all user data as one JSON object (key: GMS_UserData). • Selecting separate_keys will attach each user data as a separate key. (The name of the key will be the same as the user data key.)
Business Hours	<p>Name of the Business Hours entry for this VQ. This name must correspond to one of the entries in Business Hours.</p> <ul style="list-style-type: none"> • If Immediate Offer Hours is not configured, these hours apply to both immediate and scheduled callbacks. • If Immediate Offer Hours is configured, these hours apply only to scheduled callbacks. • For immediate callbacks, these hours indicate when immediate callback is to be offered (up until the time specified by Immediate Blackout, if configured). • For scheduled callbacks, these hours indicate when timeslots will be available for booking scheduled callbacks.
Immediate Offer Hours	<p>Name of the Business Hours object that defines the hours when Immediate callback is to be offered. This name must correspond to one of the entries in Business Hours.</p> <ul style="list-style-type: none"> • Immediate callback will not be offered if the current time plus the Estimated Wait Time (EWT) is outside of the defined Immediate Offer Hours. For example, a customer calls your contact center on Monday at 16:55. If Immediate Offer Hours are defined as Monday-Friday, 09:00-17:00, and the EWT is 10 minutes, Immediate callback is not offered to the caller. <div> <p>Important</p> <p>This option disables the Immediate Blackout option.</p> </div>

Setting	Description
Call Direction	Determines who will initiate the call to the target.
Slot Capacity	How many callbacks can be offered for each slot.
Slot Duration (minutes)	<p>Duration (in minutes) of the time slots for scheduled callbacks.</p> <p>Important This value must be a divisor of 60. The recommended values are 15 (default), 20, 30, or 60, with 60 being the maximum value you can use.</p>
Routing Point	Routing Point (RP) to use for making the outbound call.
Callback Application	The name of the Designer callback application.
Callback TTL (seconds)	<p>Specifies how long (in seconds) the callback service will be kept active in the system.</p> <p>Important Genesys recommends that you do not set this value lower than the default setting of 259200 seconds (3 days).</p>
