# Table CALLBACK_FACT

## Description

**Introduced:** 8.1.402. Supported for on-premises deployments starting with release 8.5.005.
**Modified:** 8.5.015.19 (PRODUCER_BATCH_ID added); 8.5.010.16 (UPDATE_AUDIT_KEY added);
8.5.010 (in Microsoft SQL Server, data type for various ID columns modified in multi-language
databases, as identified in the column descriptions); 8.5.009.20 (21 new columns added, as
identified in the column descriptions); 8.5.008 (data type of DS_AUDIT_KEY increased); 8.5.003
(PUSH_DELIVERY_CONFIRMED_TS and CUSTOMER_READY_TO_START_IXN_TS added;
DESIRED_TIME renamed to DESIRED_TIME_TS, which has been made mandatory)

In partitioned databases, this table is partitioned.

Each row in this table describes a callback-related event, such as a callback offer, callback
cancellation, or successful callback. The facts are based on data passed from Callback applications.
Rows are inserted at receipt of a callback-related event and are not updated. The SERVICE_ID links
the CALLBACK_FACT record with the related IRF record. There are no associated MSF records.

### Important

Whether or not rows are created for all callbacks that are offered depends on whether
Genesys Info Mart receives the required KVP(s) from Genesys Mobile Services (GMS).
Depending on your setup, the CALLBACK_FACT table might contain records for
accepted callbacks only; in this case, certain columns might be empty or might
contain default values that need to be interpreted in this context. For more
information about the circumstances in which required KVPs will be sent, see Set Up
Historical Reporting in the *Callback Solution Guide.*

### Tip

To assist you in preparing supplementary documentation, click the following link to
download a comma-separated text file containing information such as the data types
and descriptions for all columns in this table: Download a CSV file.

> **Hint:** For easiest viewing, open the downloaded CSV file in Excel and adjust settings for column widths, text wrapping, and so on as desired. Depending on your browser and other system settings, you might need to save the file to your desktop first.

## DS_AUDIT_KEY

**Modified:** 8.5.008 (data type increased from 10 to 19 digits)
The surrogate key that is used to join to the CTL_AUDIT_LOG control table. The value of this field equals the audit key of the GIDB table from which the callback-related data is taken.

## EVENT_SEQUENCE

The number of this event relative to other events associated with the same callback service.

## CREATE_AUDIT_KEY

The surrogate key that is used to join to the CTL_AUDIT_LOG control table. The key specifies the lineage for data creation. This value can be useful for aggregation, enterprise application integration (EAI), and ETL tools--that is, applications that need to identify newly added data.

## TENANT_KEY

**Based on KVP:** _CB_TENANT_DBID

The surrogate key that is used to join the TENANT dimension to the fact tables, to indicate the tenant of the IRF resource. The value of this field is identical to the value in the corresponding IRF record. Use this value to restrict data access.

## SERVICE_ID

**Based on KVP:** _CB_SERVICE_ID

The ID of the callback service request. Depending on the scenario, the value equals the ID of the GMS service instance or ID of the ORS session.

The value allows you to associate interaction details with the callback details by using the following references:

CALLBACK_FACT.SERVICE_ID = IRF_USER_DATA_GEN_1.SERVICE_ID
AND CALLBACK_FACT.START_DATE_TIME_KEY = IRF_USER_DATA_GEN_1.START_DATE_TIME_KEY

From IRF_USER_DATA_GEN_1, you can then link in the usual way to IRF records.
