Genesys Rules System Deployment Guide

DROOLS 5 Keywords

DROOLS 5 Keywords

Contents

- 1 DROOLS 5 Keywords
 - 1.1 Hard Keywords
 - 1.2 Soft Keywords
 - 1.3 Escaping Hard Keywords

Drools 5 introduces the concept of hard and soft keywords.

Hard Keywords

Hard keywords are reserved—you cannot use any hard keyword when naming domain objects, properties, methods, functions and other elements that are used in the rule text. The following list of hard keywords must be avoided as identifiers when writing rules:

- true
- false
- null

Soft Keywords

Soft keywords are just recognized in their context, enabling you to use these words in any other place if you wish, although Genesys recommends avoiding them if possible to prevent confusion. The list of soft keywords is:

```
• activation• package • attributes• template • eval

    lock-

                                                                          exists

    action

                                                                                                  init
  on-
               group
                          import
                                    rule
                                                 query
                                                             not

    forall

    reverse

  active
            · agenda-

    dialect
    extend
    declare
    in

    accumulate result

    date-

               group
  effective
• ruleflow- • salience • when
                                                 • function • or

    collect

                                                                                      end
· date-
               group

    global

    enabled
    then

                                                                          • from
                                                             and
                                                                                      over
  expires
            entrv-

    no-

              point
  loop

    duration

 auto-
  focus
```

You can use these (hard and soft) words as part of a method name in camel case, for example notSomething() or accumulateSomething() without any issues.

Escaping Hard Keywords

Although the three hard keywords above are unlikely to be used in your existing domain models, if you absolutely need to use them as identifiers instead of keywords, the DRL language provides the ability to escape hard keywords on rule text. To escape a word, simply enclose it in grave accents, like this:

```
Holiday( `true` == "yes" ) //
```

Please note that Drools will resolve that reference to the method:

Holiday.isTrue()
