Displaying Package History

Displaying Package History

GRAT tracks all changes made to a package and displays them in a tab called **Package History**. This tab displays the package history at either individual package level or across a Tenant. At the Tenant level, the tab displays a history of all changes to all packages for that Tenant.

You can filter by package name, snapshot name, description of change or by the user who made the change, and you can sort by any column, either the entire results or within a filtered subset.

Every saved change made to a package causes a new package version to be generated. This package version is displayed on the **Package History** tab, as well as on the **Deployment History** view.
