Chat Widget JS API

Deprecation notice

- **Starting with the 8.5.000.38 release of Genesys Web Engagement, Genesys is deprecating the Native Chat and Callback Widgets—and the associated APIs (the Common Component Library)—in preparation for discontinuing them.**

This functionality is now available through a single set of consumer-facing [digital channel APIs](#) that are part of Genesys Mobile Services (GMS), and through [Genesys Widgets](#), a set of productized widgets that are optimized for use with desktop and mobile web clients, and which are based on the GMS APIs.

Genesys Widgets provide for an easy [integration](#) with Web Engagement, allowing you to proactively serve these widgets to your web-based customers.

Important

Although the deprecated APIs and widgets will be supported for the life of the 8.5 release of Web Engagement, Genesys recommends that you move as soon as you can to the new APIs and to Genesys Widgets to ensure that your functionality is not affected when you migrate to the 9.0 release.

- Note that this support for the Native Chat and Callback Widgets and the associated APIs will not include the addition of new features and that bug fixes will be limited to those that affect critical functionality.

How the API is Structured

The Chat Widget JS API is made up of the three main methods:

- [startChat](#)—Use this method as the entry point for starting a chat session.
- [restoreChat](#)—Use this method to restore the chat widget after page reload when working in "embedded" mode (the chat window is rendered on a website's page, not in a separate browser window)
- [startChatInThisWindow](#)—Use this method for chat sessions appearing in a separate dedicated HTML page. For cases where chat is started in "popup" mode (chat is rendered in a separate browser window).

Additional methods are also available since chat version 850.6.0, see [Additional Methods](#).

Browser Support and Cookies

Browser Support

Chat widget fully supports IE8+, Firefox, Safari and Chrome desktop browsers. On mobile, Safari on iOS 7 and Google Chrome on latest Android are officially supported, though chat may properly function in other browsers / OSes. Notes on IE7 support:

- Chat widget depends on JSON parsing functionality. To enable it in IE7, you have to use a third-party library (for example, [json2.js](#) by [JSON creator Douglas Crockford](#)). Note that this kind of library might be already included if you use chat as part of another product (like Web Engagement).
- Built-in UI uses [data:uri technology](#) for images, which is not supported by IE7. This is why the minimize and close buttons and the Genesys logo are not visible in this browser. You have to [customize the CSS](#) if you need chat support in IE7.

Note on cookies

The Chat Widget uses a few cookies that allow it to function properly across multiple pages / browser windows. Also, to function properly across different subdomains, chat widget writes cookies to the **"root" domain of your site**. For example, if your site's domain is `www.example.com.au`, the cookies are written to the `.example.com.au` domain, which makes them available to all other subdomains of your site.

Getting Access to Chat Session API

Embedded Mode

Getting access to the Chat Session API in embedded mode

If you want to ensure consistent access to the Chat Session API in "embedded" mode, you need to accommodate two done callbacks: one for `startChat` and `restoreChat`.

For example,

```
function handleChatSession(session) {
    // Use session API here to send messages, subscribe to events etc.
}

chat.restoreChat(options).done(handleSession)
    .fail(function() {
        chat.startChat(options).done(handleSession);
    });
// Example is artificial in that it starts new chat unconditionally, if it has not been
// started yet.
```

// See documentation below for more elaborate examples of working with chat start/restoration.

Popup Mode

Getting access to the Chat Session API in popup mode

To get access to the Chat Session API in "popup" mode, you have to accommodate the done callback for the `startChatInThisWindow` method in the separate HTML page for the widget.

For example,

myChatWidget.html

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="utf-8">
  <meta http-equiv="X-UA-Compatible" content="IE=edge">
  <meta name="viewport" content="width=device-width, initial-scale=1">
  <title>Genesys Chat</title>
</head>
<body>
<script src="js/chatWidget.js"></script>
<script>
  chat.startChatInThisWindow().done(function(session) {
    // Use session API here
  });
</script>
</body>
</html>
```

...and then pass the URL of this HTML page to the `startChat` method on your website's page:

```
chat.startChat({
  embedded: false,
  widgetUrl: 'http://example.com/myChatWidget.html',
  // ...
});
```

Customizing the User Interface

There are different options for customizing the chat widget UI — from style modifications via CSS to complete disabling, with JavaScript-based customization in between.

Template-based

Template-based Customization

Important

Make sure to read about the **templates** option first.

You can use a template-based customization approach, which boils down to editing plain HTML, if any of the following are true:

- You want to modify the structure of the widget.
- You want to add content or CSS classes to the widget.
- You do not want to use JavaScript to work with the DOM.

The basic algorithm for template-based customization is to do the following:

1. Get the HTML with default templates. You can get the default templates from:
 - Web Engagement Server 8.5.1 at `http(s)://<WE_HOST>[:<WE_PORT>]/server/api/resources/v1/chatTemplates.html`.
 - Web Engagement Server 8.5 at `http(s)://<WE_HOST>[:<WE_PORT>]/server/resources/chatTemplates.html`.
 - Web Engagement Frontend Server 8.1.3 at `http(s)://<FRONTEND_HOST>[:<FRONTEND_PORT>]/frontend/resources/chatTemplates.html`.
2. Modify the templates.

Tip

All **localization** data is available inside your templates as a `data.nls` object.

Important

To keep all functionality intact, Genesys recommends you do not remove elements or CSS classes when editing the chat templates.

3. Insert the modified template(s) into your page's HTML code somewhere between the `<body>` and `</body>` tags.

Example HTML page:

```
<!DOCTYPE html>
<html lang="en">
<head>
  <title>My Page</title>
  [GENESYS INSTRUMENTATION]
</head>
<body>
<h1>This is my page.</h1>
<p>It has some content.</p>

<script type="text/html" data-gwc-template="embeddedWindow">
  [MODIFIED TEMPLATE CONTENT]
</script>
<script type="text/html" data-gwc-template="chatMessage">
  [MODIFIED TEMPLATE CONTENT]
</script>
</body>
```

Starting with chat versions **850.6.0**, chat automatically recognizes and uses the template from the `data-gwc-template` attribute. If using an earlier version, see the next step.

4. Another option is to host the modified HTML templates somewhere accessible using HTTP. If you choose to download templates over the network, configure chat to use downloaded templates by passing the URL of your HTML file to the **templates** option of your chat configuration.

Important

If you use both in-page templates and downloaded templates, the downloaded templates take priority.

Tip

You can use the Web Engagement Server server to host static resources. This is especially useful for resources like chat templates because the server is configured with JSONP support. For details, see [Hosting Static Resources - JSONP](#).

Chat Widget Template System

The chat widget templates are included in the **chatTemplates.html** file. This file is not a static HTML file, but a collection of small client-side templates wrapped in `<script>` tags. To learn more about this templating technique, see http://en.wikipedia.org/wiki/JavaScript_templating. The chat widget template system is based on the popular lodash/underscore templates: <http://lodash.com/docs#template>, <http://underscorejs.org/#template>.

The chat widget template uses 5 HTML-based templates:

- **chatRegistration** for the built-in registration form
- **chatTyping** for the "Agent is typing" message

- **chatMessage** for all other messages in a chat
- **chatView** for the basic structure of the chat widget
- **embeddedWindow** for the "chat window" wrapper in "embedded" mode

These templates are included in the **chatTemplates.html** file, which has the following structure:

```
<!-- embeddedWindow.html -->
<script type="text/html" data-gwc-template="embeddedWindow">
    ...
</script>

<!-- chatRegistration.html -->
<script type="text/html" data-gwc-template="chatRegistration">
    ...
</script>

<!-- chatView.html -->
<script type="text/html" data-gwc-template="chatView">
    ...
</script>

<!-- chatMessage.html -->
<script type="text/html" data-gwc-template="chatMessage">
    ...
</script>

<!-- chatTyping.html -->
<script type="text/html" data-gwc-template="chatTyping">
    ...
</script>
```

Important

To keep all functionality intact, Genesys recommends that you do not remove elements or CSS classes when editing the chat templates.

Customization Examples

- [Substituting the Genesys Logo with a Custom Image](#)
- [Adding Extra Content to the Chat Widget](#)
- [Displaying a character counter in the message area](#)
- [Replace **Skip Registration** button with **Exit** button](#)
- [Automatically expand text area based on user input](#)

CSS-based

CSS-based Customization

The chat widget JavaScript contains all of the CSS needed to render chat, which is automatically added to the `<head>` section of the web page when chat is initialized.

You can override any of the default styles by adding a `<link>` or `<style>` tag with CSS rules for the chat widget (since the default CSS is added to the beginning of `<head>`, your custom styles will always take higher priority).

Tip

To see exactly what you can override, use the developer tools native to most web browsers. Currently, we do not document our CSS and do not guarantee backwards compatibility for future versions of chat.

Important

To avoid potential CSS conflicts, all of chat widget's class names are prefixed with "gwc-".

Customization Examples

- [Modifying the Styling of the Chat Messages](#)
- [Adding Extra Content to the Chat Widget](#)

JavaScript-based

JS-based Customization

In case you want to modify more than just the style (look and feel) of the chat, but also the logic of the widget, you can use "hooks" for customizing the built-in UI. See the [ui](#) option for details.

Most of the time, you can make additions or modifications to the chat widget layout using the template-based customization. You might choose JavaScript-based customization over template-based if:

- The customization is small enough so that the DOM-related work can be easily done with JavaScript (provided you are experienced with JavaScript).
- The customization impacts not only the layout, but also the logic (for example, if you need additional event handlers).

Complete override

It is possible to disable the built-in UI and implement your own based on the session API:

```
startChat({
  //...
  ui: false,
}).done(function(session, options) {
  // Implement your own UI using session API
});
```

Customization Examples

- [Using the ui.onBeforeMessage Hook to Add Desktop Modifications](#)
- [Displaying a confirmation alert when users close the chat widget](#)
- [Implementing a client-side chat session timer](#)
- [Inserting a line break with Shift+Enter](#)
- [Automatically opening a URL pushed by an agent](#)
- [Showing the number of unread messages in a minimized chat widget](#)
- [Showing an agent typing notification in the minimized chat widget](#)
- [Displaying a character counter in the message area](#)
- [Replace **Skip Registration** button with **Exit** button](#)
- [Automatically expand text area based on user input](#)

Localization

The Chat Session API (startChat and restoreChat methods particularly) includes an optional localization parameter that accepts one of the following:

- JavaScript object with localization data
- Function that returns an object with localization data
- Function that accepts a callback and calls that callback with an object containing localization data
- URL of an external JSON file with the localization data

Localization data is fetched or passed before chat initialization and merged with the default localization.

Important

For security reasons, in "popup" mode (separate window) data is fetched via AJAX (not JSONP), which means that **the chat widget html file and the localization file must be on the same domain**. Otherwise (or in case of invalid URL) an error is

thrown and the chat silently fails.

In "embedded" mode, the localization data is always fetched using [JSONP](#). This lets you host the data on another domain, separate from the site itself. You can use Web Engagement server to host the content for you, as they both support JSONP out-of-the-box. See [GWE Architecture—Hosting Static Resources](#).

```
// This will work: widget and l18n are on same domain: example.com
chat.startChat({
  widgetUrl: 'http://example.com/chatWidget.html',
  localization: 'http://example.com/chatLocalization.json',
  embedded: false
});

// This won't work: they are on different domains
chat.startChat({
  widgetUrl: 'http://example.com/chatWidget.html',
  localization: 'http://another-domain.com/chatLocalization.json',
  embedded: false
});

// This will work: files are on different domains, but chat is started in
// embedded mode,
// so JSONP is used (here we use Genesys Web Engagement server for JSONP)
chat.startChat({
  widgetUrl: 'http://example.com/chatWidget.html',
  localization: 'http://<GWE_SERVER>/server/api/resources/v1/
chatLocalization.json',
  embedded: true
});
```

The passed localization object or external JSON file may contain any of the fields listed below. Fields that are not present will be taken from built-in default localization.

Built-in localization

```
{
  "chatTitle": "Genesys Chat",
  "chatWelcome": "Hello! Next available customer representative will be with you shortly.",
  "defaultUsername": "User",
  "defaultAgentName": "Representative",
  "ownUsername": "You",
  "chatEnded": "Chat session ended",
  "agentJoined": "Representative {name} has joined the session",
  "agentLeft": "Representative {name} has left the session",
  "agentTyping": "{agentName} is typing...",
  "serverStopped": "Connection to chat has been interrupted. Trying to restore...",
  "serverUnreachable": "Chat is unavailable now. Please try again later.",
  "networkInterrupted": "Connection to chat has been interrupted. Trying to restore...",
  "networkRestored": "Connection restored.",
  "unknownServerError": "Chat is unavailable now. Please try again later.",
  "chatSessionExpired": "Chat session has expired.",
  "regFirstName": "First Name:",
  "regLastName": "Last Name:",
  "regEmail": "Email:",
  "regSubmit": "Start Chat",
  "regSkip": "Skip Registration",
```

Built-in localization

```
{
  "regWelcomePart1": "Please enter few details about you, and press Start Chat button.",
  "regWelcomePart2": "Next available customer representative will be with you shortly.",
  "regErrorRequiredField": "\\\"{field}\\\" is a required field",
  "regErrorInvalidEmail": "Please enter a valid email address",
  "leaveSessionPrompt": "You are going to leave chat session."
}
```

Procedure: Step-by-step instruction for using an external localization file

Steps

1. Create a localization file with all / some of the fields overridden.
For example suppose you want to have chat title and welcome message in Russian:

```
{
  "chatTitle": "Наш уютный чат",
  "chatWelcome": "Здравствуйте! Наш представитель будет с вами в ближайшее время."
}
```

Copy and paste the code above (or craft your own) and save it as `.json` file.

2. We recommend that you check to make sure that the syntax of the JSON file is correct. You can do this online, using this service: <http://jsonlint.com/>
3. Host the file on any server. If you want to support localization for chat in "embedded" mode, you have to configure **JSONP** support on the server.

Important

Genesys Web Engagement supports serving JSONP. See [GWE Architecture—Hosting Static Resources](#).

4. Use the URL for this file as the value of the `localization` option in `startChat`.

```
chat.startChat({
  localization: 'http://my-server.com/my-chat-localization.json',
  // other parameters
})
```

5. After starting the chat, you should see something like this (sample is in "embedded" mode):

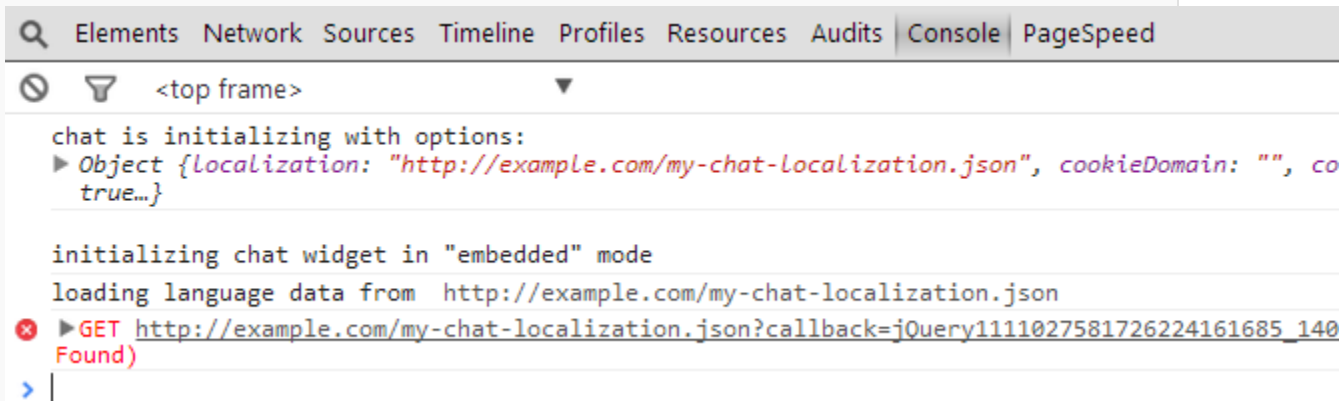

6. Troubleshooting

If localization fails to load or parse, the chat will not start, signaling that something went wrong. To see what went wrong you will have to:

- Enable "debug" mode:

```
chat.startChat({
  localization: 'http://my-server.com/my-chat-localization.json',
  debug: true,
  // other parameters
});
```

- Enable browser developer tools (for example, in Chrome and most of other browser you can press F12 to launch).
- You should see something like this:

Here you can see that localization was not found on the server (response 404).

And here is another example of what you can see if JSON is either invalid or improperly configured:
