Web Services and Applications Migration Guide

Upgrading from 8.5.201.29 to 8.5.203.03

5/10/2025

Upgrading from 8.5.201.29 to 8.5.203.03

1. Stop Web Services and Applications on the node.

2. Migrate to OpenJDK 8 according to Migrating to OpenJDK 1.8.0.

3. Backup your old installation and configuration files. You might need the files if you need to rollback your upgrade at a later date. Make sure to back up the following files if you configured the previous version as a service:

   - **/etc/init.d/gws**

   - **/etc/default/gws**

4. Remove the following service initialization scripts from the host:

   - **/etc/init.d/gws**

   - **/etc/default/gws**

5. Deploy the new version of Web Services and Applications.

6. Copy the following configuration files from the configuration folder in your previous installation into the **config** folder in the home directory of the new installation:

   - **application.yaml**

   - **elasticsearch.yml**

   - **hystrix.properties**

   - **logback.xml**

   - **statistics.yaml**

7. On the Red Hat Linux 6 platform, open the **/etc/default/gws** file and update the following environment variables to values appropriate for your Web Services and Applications node:

   - **GWS_HOST**: This value must match the **host** value defined in the **jetty** section of the **application.yaml** file.

   - **GWS_PORT**: This value must match **port** value defined in the **jetty** section of the **application.yaml** file.

8. Update the **application.yaml** file with the new path to the **logback.xml** file.

9. Adjust the **updateOnStartup** option in the **application.yaml**. See Web Services and Applications deployment update.

10. Update the Cassandra schema:

    - If you are using Cassandra 2.x:

      - Copy the `cf-schema-8.5.201.84.cql` file from /installation_path/gws/data/updates to the Cassandra node host.

      - Run the following command:

        ```
        cqlsh cassandra_host --file cf-schema-8.5.201.84.cql
        ```

      - Copy the `cf-schema-8.5.202.34.cql` file from /installation_path/gws/data/updates to the

Cassandra node host.

- Run the following command:

```
cqlsh cassandra_host --file cf-schema-8.5.202.34.cql
```

- Copy the `cf-schema-8.5.202.81.cql` file from /installation_path/gws/data/updates to the Cassandra node host.

- Run the following command:

```
cqlsh cassandra_host --file cf-schema-8.5.202.81.cql
```

- If you are using Cassandra 1.2:

  - Copy the `cf-schema-8.5.201.84.txt` file from /installation_path/gws/data/updates to the Cassandra node host.

  - Run the following command:

```
cassandra_install_dir/bin/cassandra-cli -h cassandra_host --file cf-
schema-8.5.201.84.txt
```

  - Copy the `cf-schema-8.5.202.34.txt` file from /installation_path/gws/data/updates to the Cassandra node host.

  - Run the following command:

```
cassandra_install_dir/bin/cassandra-cli -h cassandra_host --file cf-
schema-8.5.202.34.txt
```

  - Copy the `cf-schema-8.5.202.81.txt` file from /installation_path/gws/data/updates to the Cassandra node host.

  - Run the following command:

```
cassandra_install_dir/bin/cassandra-cli -h cassandra_host --file cf-
schema-8.5.202.81.txt
```

11. Start Web Services and Applications according to Starting and testing.

12. After all Web Services and Applications nodes are upgraded and started, update Elasticsearch:

- If you use embedded Elasticsearch, run the following script on *one* Web Services and Applications node:

```
/installation_path/gws/tools/rebuild-es-index.sh
```

- If you use standalone Elasticsearch:

  - Copy files from the `/installation_path/gws/elasticsearch/templates` folder to the templates folder on each Elasticsearch node.

  - Run the following script on *one* Web Services and Applications node:

```
/installation_path/gws/tools/rebuild-es-index.sh
```
