CfgAppServicePermission

Description

Attributes

- `appType` — Type of the application this permission mask relates to. See [CfgAppType](#). Mandatory. Once specified, cannot be changed. The same value cannot be repeated within one list.
- `permissionMask` — Application permission mask. Recommended to be set to “all ones” by default.

Comments

The only purpose of service permission masks is to control what functionality of a certain application is available within the service where it is used. The decision on whether to use service-based access to application's functions and availability of what functions to make service-dependent shall be determined exclusively by the feature requirements to that application type and made part of the functional specification for that application type. Level of access of a particular application to the Configuration Database objects does not depend in any way on settings of the above parameters.
