What's New

This release includes only resolved issues.

Resolved Issues

This release contains the following resolved issues:

GMS performance is improved in scenarios that involve callback request processing. (GMS-2231)

In chat scenarios, GMS now returns a relative URL only if you set the _relative_url parameter to true in your chat query.
Previously, GMS returned relative URLs if the query did not include the _relative_url parameter. (GMS-2236)

If the Configuration Server restarts, GMS now correctly reconnects in warm-standby mode. Previously, in this scenario, GMS did not reconnect to the Configuration Server. (GMS-2239)

GMS now correctly removes expired resources. Previously, if a resource was allocated but not released, GMS did not remove it, even after its expiration date. (GMS-2243)

GMS applications now correctly manage ADDP connections to the Configuration Server. (GMS-2257)

In case of registration failure, GMS now reconnects to the Configuration Server through the warm standby procedure. (GMS-2249)

Upgrade Notes

No special procedure is required to upgrade to release 8.5.101.09.
