SIP Endpoint SDK for .NET Release Notes

Release Date	Release Type	Restrictions	AIX	Linux	Solaris	Windows
09/24/20	General					X

What's New

This release contains the following new features and enhancements:

- SIP Endpoint SDK recovery from audio device failures, has been improved by adding additional attempts to restart audio stream in case of errors. (SEPSDK-2676)

Resolved Issues

This release contains the following resolved issues:

Handling of TCP client-side ports for TCP and TLS connections has been improved. If the first selected port is not available (for example, because of a TIME_WAIT state caused by a recently closed port), then the other ports in the range are tried for connecting. (SEPSDK-2684)

SIP Endpoint SDK now correctly handles G.729 codec with packet size of 60 milliseconds (SDP parameter ptime=60). Previously, such packets were processed incorrectly, only taking first 40 milliseconds of audio, resulting in poor audio quality. (SEPSDK-2683)
