What's New

This release contains the following new features and enhancements:

- In a Virtual Desktop Infrastructure (VDI), the new option **interaction-workspace\sipendpoint.standalone.vdi-detection-use-dns** has been introduced. This lets the Administrator specify whether Workspace relies on DNS resolution to identify the IP address used to connect to the standalone Workspace SIP Endpoint. The default value is `true`. Set this option to `false` in environments where the VDI server's DNS resolution of client workstation hostnames is unreliable. See [Configuration and administration by using options and annexes](#) for information about configuring Workspace options. (IW-16626)
