ISCC Transaction Monitoring

4/16/2025

ISCC Transaction Monitoring

ISCC Transaction monitoring is a feature for working with multi-site environments. ISCC is an internal T-Server component responsible for T-Server's multi-site operations such as multi-site call transfer, inter-site call linkage, call overflow, and other, possibly non-call-related, multi-site operations. Internally, those operations are called *transactions*.

This section describes the interfaces that allow you to work with ISCC Transaction Monitoring: the `TTransactionMonitoring()` function, the `TSubscriptionOperationType` enumeration, and `EventTransactionStatus`. Use these to subscribe and work with this feature. In particular, the key-value pairs of the `Extensions` attribute returned in `EventTransactionStatus` expose details of call-transfer availability (the current state of ISCC transactions), such as delays and losses, in the multi-site environment.

The content of this section represents the implementation of the transaction model exposed as an extension of the existing T-Library SDK.

This section has the following subsections:

- [The Subscription Type](#)
- [Subscribing to Transaction Monitoring](#)
- [The Transaction Monitoring Event](#)
- [Transaction Monitoring States](#)
- [Transaction Monitoring Elements](#)
